TI Present several items on ceria-based ceramic electrolytes: synthesis, additive effects, reactivity and electrochemical behavior

AB Ceria-doped electrolytes have been extensively studied, because they are promising candidates for intermediate temp. solid oxide fuel cells (ITSOFC). In this work, several relevant aspects, such as powder synthesis, small additive effects, reactivity of electrode/electrolyte and interface microstructure were described. The combustion synthesis is a really suitable synthesis route to achieve, at low temps., finely, homogeneous and reactive powders for ceria based electrolytes. The presence of small amts. of titania is beneficial, since it produces a significant redn. of the grain boundary resistance. On the other hand, the reactivity of the ceria electrolyte against lanthanum-NiO perovskites at high temps. (1475.degree.), enhances both the LaNiO3-.delta. decompn. and the diffusion of Ni and La ions as is noted in the reactivity anal.
